Our understanding of the function of
natural killer (NK) cells has dramatically
changed in recent years. The discovery
of NK receptors specific for MHC class I
molecules, and the study of the role of
co-stimulatory and adhesion molecules
have led to an understanding of how NK
cells recognize tumor and virally
infected cells that have lost expression
of MHC class I molecules or have altered

measures of the performance of a binary classification test that are widely used in medicine: . Sensitivity measures the proportion of positives that are correctly identified (e.g., the percentage of sick people who are correctly identified as having some illness).; Specificity measures the proportion of negatives that are correctly identified (e.g ...

Mycorrhiza specificity phenomena significantly influence plant community dynamics, particularly plant succession. Early seral plants can positively affect the establishment of later-seral plants by maintaining commonly shared mycorrhizal fungi, and thus affecting the function of common mycelial networks over time.

LIM domains are found in a variety of proteins, including cytoplasmic and nuclear LIM-only proteins, LIM-homeodomain (LIM-HD) transcription factors and LIM-kinases. Although the ability of LIM domains to interact with other proteins has been clearly established in vitro and in cultured cells, their in vivo function is unknown. Here we use *Drosophila* to test the roles of the LIM domains of the ...

NK1 T cells are a specialized population of α/β T cells that coexpress receptors of the NK lineage and have the unique potential to very rapidly secrete large amounts of cytokines, providing early help for effector cells and regulating the Th1 or Th2 differentiation of some immune responses. NK1 T cells express a restricted TCR repertoire made of an invariant TCR α chain, V α 14-J α 281 ...
